1 Introduction

The international workshop „Capacity-Building for Biodiversity in Central and Eastern Europe“ brought together 27 experts from 12 European countries from December 03-06, 2003. It was organized by the German Federal Agency for Nature Conservation at its conference centre, the “International Academy for Nature Conservation” on the Isle of Vilm.

The aim of the workshop was to provide an opportunity for an exchange of ideas and experiences between representatives from governmental and scientific institutions as well as intergovernmental and non-governmental organizations involved in capacity-building activities with regard to biodiversity issues in the countries of Central and Eastern Europe. Among the main topics for discussion were the possible tasks and functioning of a regional centre or network for capacity-building to promote the implementation of the Convention on Biological Diversity (CBD), and the capacity needs of countries in the region.

The idea of developing a network of regional centres or partners for capacity-building in Africa, Asia and the Pacific, Latin America and the Caribbean and Central and Eastern Europe has been proposed by the Executive Secretary of the CBD for further examination in document UNEP/CBD/MSP/5. In organising the workshop, the Federal Agency was also led by Decision VI/27 of the Conference of the Parties, which “invites Parties, Governments, and relevant organizations to strengthen their existing regional and subregional mechanisms and initiatives for capacity-building and to contribute inputs regarding their experiences into the wider assessment process” with regard to regional and subregional instruments and mechanisms for enhancing CBD implementation.

The workshop was set up as an informal scientific meeting and the participants attended in their personal capacity as biodiversity experts. The meeting was chaired by Dr. Horst Korn. The outcomes presented here do not necessarily mean that consensus has been achieved on every individual point.

In this report the results of the five working sessions are summarized and recommendations are given to help individuals and organizations in their work and to contribute to further discussion on the issue.

The Role of Capacity-Building in the CBD Process - An Overview of Relevant Documents and Developments

CORDULA EPPLE

Introduction

The Convention on Biological Diversity (CBD) is the most important international agreement dealing with the challenge to maintain biodiversity in spite of the many threats to which it is currently exposed. Its implementation requires a wide range of activities at the national and local level. Building and/or enhancing the capacity of potential actors in all member states to contribute to the conservation and sustainable use of biological diversity is therefore a central concern in the CBD process. Already in the preamble of the Convention, the "urgent need to develop scientific, technical and institutional capacities" in order to be able to "plan and implement appropriate measures" is mentioned.

Among the articles of the CBD, the following contain provisions which relate to capacity-building: Article 12 (Research and Training), Article 13 (Public Education and Awareness), Article 17 (Exchange of Information) and Article 18 (Technical and Scientific Cooperation). Article 18 (3) calls for the establishment of the Clearing-House Mechanism (CHM), which aims to facilitate cooperation and information exchange within and between the Parties to the Convention.

Understanding of Capacity-Building

There is no definition of "capacity-building" in the text of the Convention or in the decisions of its governing body, the Conference of the Parties (COP). However, the use of the term in CBD documents is generally supportive of a wide understanding of capacity-building, which includes not only the training of individuals and the build-up and strengthening of institutions, but also the creation of enabling environments. This latter aspect may involve for example the development of supportive legal and policy frameworks, institutional mechanisms for policy integration and the mainstreaming of biodiversity into the work of other sectors, mechanisms for stakeholder involvement and participation, support for networks and information exchange systems or the introduction of appropriate incentive measures.

Over the past years, such a broad notion of the scope of the term has come to be widely accepted in international fora dealing with environmental issues. According to a definition based on the work of the Capacity Development Initiative led by the Global Environmental Facility (GEF) and the United Nations Development Program (UNDP) (GEF 2001), "'capacity building' can be taken as 'the actions needed to enhance the ability of individuals, institutions and systems to make and implement decisions and perform functions in an effective, efficient and sustainable manner.'"
Background

**Relevant documents and developments**

The implementation of the CBD has to be based on both the convention text and the decisions of the Conference of the Parties. Already at the first meeting of the COP in 1994, in Decision I/9 on the medium-term programme of work up to 1997, the Parties emphasized "the importance of capacity-building as one of the elements of successful implementation of the Convention" (Dec. I/9, Annex (4)). Capacity-building was also included among the programme priorities for support by the financial mechanism of the Convention (Dec. I/2, Annex I (III e)).

Since then, guidance on capacity-building has been given in the decisions of every COP meeting and is included in the work on almost all of the thematic programmes and cross-cutting issues treated under the Convention. As a consequence of the declared shift of focus from policy formulation to implementation at COP 6 in 2002, the weight accorded to capacity-building and the degree of detail of the provisions have increased further.

The following list gives an overview of the thematic areas of COP decisions which make reference to capacity-building:

- Access to genetic resources and benefit-sharing
- Agrobiodiversity
- Art. 8j and rel. provisions (traditional knowledge)
- Alien invasive species
- Biodiversity of Inland Waters
- Biosafety
- Clearing House Mechanism
- Dryland Biodiversity
- Ecosystem Approach
- Education and Public Awareness
- Ex-situ collections
- Forest Biodiversity
- Global Strategy for Plant Conservation
- Identification and monitoring
- Impact assessment
- Incentive measures
- Indicators
- Liability and redress
- Marine and Coastal Biodiversity
- Coral Reefs
- National Reporting
- Sustainable Use
- Taxonomy
- Tourism

According to the Multi-Year Programme of Work of the COP up to 2010 (cf. document UNEP/CBD/COP/7/5), the refinement of mechanisms to support implementation of the Convention (such as the financial mechanism, the clearing-house mechanism, technology transfer and capacity-building) will also be considered as a separate item on the agenda of every meeting until COP 10.

The “Strategic Plan for the Convention on Biological Diversity” (Dec. VI/26), which was adopted by COP 6 in 2002, identifies the improvement of the financial, human, scientific, technical and technological capacity of Parties to implement the Convention as one of four central goals. This goal is further elaborated among others by the following objectives:

- “All Parties have adequate capacity for implementation of priority actions in national biodiversity strategy and action plans.” and
- “Developing country Parties, in particular the least developed and the small island developing States amongst them, and other Parties with economies in transition, have sufficient resources available to implement the three objectives of the Convention.”

In promoting the implementation of the CBD, regional and subregional mechanisms and networks can play an important role, which is acknowledged in Decision VI/27. The same decision invites Parties, Governments, and relevant organizations to strengthen their existing regional and subregional mechanisms and initiatives for capacity-building.

The Clearing-House Mechanism, which was established on the basis of Article 18 (3) to promote technical and scientific cooperation (see above), has over the past years developed into an extensive network with a large number of national and thematic focal points. It has a strong internet component, which should, however, not be seen as the only element of the CHM, but rather as the fundament on which further activities can be developed. In the strategic plan of the CHM for the period 1999-2004, “training and capacity-building” is identified as one of six key areas of cooperation to be promoted by the work of the mechanism (cf. UNEP/CBD/COP/5/INF/3).

The importance of capacity-building is also emphasized in the Cartagena Protocol on Biosafety, which was adopted by the COP in 2000 as the first supplementary agreement to the CBD and entered into force in September 2003 after ratification by 50 Parties. In 2001, an Action Plan for building capacities for the effective implementation of the Protocol was endorsed. To support capacity-building activities, internet databases on capacity-building opportunities, ongoing projects and initiatives, lessons learned from completed projects and national and regional capacity-building needs have been set up (see http://bch.biodiv.org/Pilot/CapacityBuilding/Getting Started.shtml).

When considering developments relevant to capacity-building in the framework of the CBD, one should also keep in mind the work which is under way on related issues such as Technology transfer (especially with regard to "soft technologies", i.e. skills and knowledge), Education and public awareness, and issues connected with the creation of enabling environments, such as Incentive measures.

The documents and decisions cited in the text can be found at the website of the Secretariat of the CBD at http://www.biodiv.org
3 Results and Recommendations of the Workshop

Working Group 1: Instruments for Capacity-building

Introductory remark: In this working session, a list of commonly applied instruments for capacity-building was drawn up and discussed. It was noted that for certain categories of capacity needs, a lack of available instruments is apparent.

Results

Capacity-building is an integral part of development work. To achieve its goals, capacity-building work should be organised at three levels:

1. **Individual/human resource**
   - If e.g. inspectorates are the important units for environmental law implementation at the local level, adequate skills can be enhanced for more effective work on the ground by training the inspectors of the ministry of environment.

2. **Organisational**
   - If e.g. a ministry fails to provide relevant working conditions for the skilled personnel, their skills and knowledge won’t be applied and erode over time.

3. **Systemic**
   - If e.g. there are no functional legal mechanisms at the systemic level, inspectorates will not be able to perform accordingly.

These levels are highly interconnected and precondition each other, therefore enabling environments should be created at all three levels. Albeit knowledge and skills of individuals are important (level 1), they alone are not sufficient.

The working session identified the following instruments for capacity-building:

1. **Printed material:**
   - Publications
   - Studies
   - Assistance tool kits
   - Manuals
   - Articles

2. **Face-to-face:**
   - Training
   - Training of trainers
   - Info days
   - Study visits / Exchange visits / Twinning
   - Seminars (for various purposes: training, exchange of ideas, elaborating concepts etc)
   - Pilot projects
Results and Recommendations

- Helpdesks
- Expertise exchange
- Coaching

3. **E-tools:**
- Providing information on the internet
- Web based learning
- Clearing House Mechanism

**Other instruments**, which have been mentioned, are:
- Public participation
- Lobbying (Advocacy)
- Schools
- Environmental Impact Assessment (EIA)
- Strategic Environmental Assessment (SEA)

The above-mentioned instruments mainly relate to individual human resource development (level 1). More work needs to be done on level 2 and level 3.

The participants identified the following **subjects for further discussion:**
- The role of information exchange for capacity-building
- The importance of networking (for information exchange and/or integration of activities) as an instrument for capacity-building
- The significance of financial instruments for NGOs and governments in capacity-building
- The significance of Needs Assessments for capacity-building
- The role of mass media in capacity-building
- The use of local knowledge for capacity-building
- The use of scientific knowledge for capacity-building

Generally participants expressed the need for new capacity-building instruments and the need for a further development of existing capacity-building instruments for (a) local people, (b) politicians, and (c) media.

**Working Group 2: Tasks and Structure of a Regional Centre or Network for Capacity-building**

*Introductory remark: The aim of this working session was to outline the main tasks and structural features of a regional centre/network for capacity-building as they could be applied for the Central and Eastern European countries (CEECs), but also in other regions of the world.*
Regional background information gathering (e.g. taking into account results from National Capacity Self-Assessments (NCSA)) and needs identification are prerequisites for establishing a regional centre for capacity-building. The establishment of the centre will be based on and will further strengthen the existing structures. This centre could serve as a hub for a larger regional network of actors, and its activities will be open to all stakeholders. For fulfilling the aims of the centre, experiences and information gathered by national focal points of the Convention on Biological Diversity (CBD) should be considered.

The centre should be structured into two parts: a virtual centre with links to the Clearing-House Mechanism (CHM), and a physical centre to provide a forum for face-to-face communication. According to this structure, the tasks of the two branches would be the following:

**A Physical Centre**

- Organizing workshops and training as means of capacity-building
- Continuously keeping track of capacity-building needs in the region to appropriately direct the activities of the entire centre
- Providing advice in project development, management and fund raising
- Facilitating flow of information among the different actors
- (Act as an auditor of CBD implementation process – invited by a country and gives recommendations)

**B Virtual Centre**

This will reflect the activities that have taken place at the physical centre and will additionally provide information on:

- The capacity needs of the countries (including the results of the NCSAs)
- Developments in the CBD process with regard to capacity-building (e.g. COP guidance, results of questionnaires)
- Implemented and ongoing projects as well as opportunities for new capacity-building activities
- ‘Best practices’, lessons learned and case studies
- A roster of experts

In its capacity-building mission the centre should take a proactive role as well as respond to the specific demands of the stakeholders. It should maintain a flexible approach to adapt to future needs and trends (future developments), and motivate other actors to incorporate the objectives of the CBD into their capacity-building activities.
Working Group 3: Priority Areas for Capacity-Building for Biodiversity Conservation and Sustainable Use in Central and Eastern Europe

Introductory remark: The aim of this working session was to identify thematic areas in which capacity-building would be particularly valuable in Central and Eastern European countries (CEECs). Every participant from a CEEC was asked to select a maximum of three priorities from a list of thematic areas which had been drawn up based on COP guidance on capacity-building and on input from presentations at the workshop. The participants were asked to state the reasons behind their choice with special regard to the situation in CEECs. A drafting group condensed the resulting statements into a coherent text.

The order of the following priorities and thematic clusters reflects the prioritisation carried out by the participants from CEECs.

Areas of priority and thematic clusters:

1. Integrated Policy Formulation and Implementation

Rationale:
Integrated policy formulation and implementation is a crucial element of precautionary principles.

A major obstacle for the implementation of CBD objectives is the inadequate public attitude concerning biodiversity conservation, including the associated individual activities. This must be addressed by capacity-building. Therefore it seems appropriate to address the human factor in terms of changing people's understanding and attitudes towards biodiversity conservation in various thematic areas.

Capacity-building in nature conservation has to be integrated with other environmental and non-environmental activities to accomplish a full and targeted action (to avoid overlooking certain aspects).

One of the major problems in CEECs is a sectoral and isolated way of development and implementation of nature conservation and other relevant policies for the sustainable use of natural resources.

- Stakeholders have to understand the necessity of nature conservation and participate in identifying possible cross-cuts between nature conservation and other areas.
- Decision and policy makers often do not have the capacity to identify nature conservation goals, which results in a lack of structure in strategies.
- Non-integrated policies and strategies are created.
- It is essential to put designated goals and aims into practice and enforce executing bodies to establish an integrated policy approach.
Capacity-building in this matter should consider the use of new approaches and models, case studies and existing best practices.

2. Sustainable Use

Rationale:
Sustainable use is a cross-cutting issue related to a wide range of sectoral activities and the various ecosystems affected by them. It bears a challenging task for capacity-building. The conservation of biological diversity through its sustainable utilization is one of the key objectives of the CBD.

Especially in CEECs, the overarching concept of sustainable development needs to be communicated on a broader scale, as the term and its meaning are often poorly understood by actors and stakeholders.

Concerning the field of capacity-building, the task is to communicate the ecological, social and economic implications of sustainable use to actors and stakeholders.

*The following thematic areas were selected as important aspects (in order of priority):*

a) Agriculture:
Extensive agricultural practices resulted in a valuable rural landscape in CEECs and are currently maintaining great biodiversity values for the benefit of all of Europe.

➢ Agriculture plays a key role in the field of biodiversity conservation, because conservationists do not have the means to achieve biodiversity conservation in the cultural landscape by themselves alone.

➢ It is important to educate, train and inform decision makers and those implementing agriculture policies to ensure the implementation of Common Agricultural Policy (CAP) making full use of its opportunities for sustainable agricultural practices in line with conservation goals.

➢ It is important to train, educate and build capacities of stakeholders to represent their concerns related to the sustainability principles, e.g. within the CAP at EU administrative and decision making level.

b) Forests:
Issues related to forests must be dealt with using a comprehensive and holistic approach including environmental, economic and social values. In the context of capacity-building, forestry in CEECs needs enhanced resource management, as e.g. deforestation, loss of native species, mono-cultures and the insufficient use of native species and varieties for afforestation are topics of critical importance for sustainable forestry in this region.

➢ Training, educating and informing forest authorities with regard to forest certification schemes and to improve forest management in the sense of nature conservation is a target for capacity-building.
c) **Inland Waters:**
In the context of sustainable use inland waters play an important role because of the goods and services they provide (e.g. energy, food, transport, recreation).
- Focus capacity-building on those human activities that cause pollution affecting ecosystems and resulting in a reduced productivity concerning goods, services and ecological functions.

d) **Tourism:**
Tourism is recognized by the CBD as an important component of sustainable use. Therefore, the CBD developed guidelines for tourism in vulnerable areas. Concerning CEECs, tourism is one of the fastest growing economies, having at these times mostly a negative impact on the environment. This implies that tourism is not planned, managed and organized in a sustainable way.
- Minimize impacts on the environment and maximize benefits for all stakeholders through training of decision makers as well as tourism and biodiversity managers.

e) **Ecosystem Approach:**
The Ecosystem Approach developed under the CBD is a strategy for the integrated management of land, water and living resources that promotes conservation and sustainable use in an equitable way. As a framework of the objectives of the CBD it forms the fundament for building capacity, e.g. on sustainable use issues.
- The capacity of relevant sectors and stakeholders at all levels on the implementation of the Ecosystem Approach in the CEECs needs to be enhanced.

3. **Monitoring**

Rationale:
Monitoring focuses on the changes of and impacts on ecosystems, which should be incorporated in the development of policies and management approaches, considering the Ecosystem Approach.
A special issue in relation to the EU accession is the monitoring of the favorable conservation status of species and habitats, as required by the Habitats Directive.
With regard to sustainable use it is necessary to evaluate project design and to monitor implementation taking into account possible negative impacts on biodiversity.
- Institutions/individuals currently developing monitoring systems need to be linked to each other in order to identify gaps and avoid fragmentation or duplication of work.

*Thematic areas related to Monitoring:*

a) **Indicators**
- Indicators should be used to monitor and evaluate projects and to identify weaknesses and successes in order to facilitate effective adaptive management.
- It is necessary to gather and assess existing indicator systems and distribute information.
b) **Valuation Methods**

The economic benefits of governmental investments raise legitimate and important public policy questions, but the answers are often ambiguous and difficult to justify. Agency staff may not always be able to provide acceptable answers with regard to the environmental costs and/or benefits of a project - no matter how much money they spend on analysis. However, if there are no substantiated estimates on a sound theoretical basis of the benefits of environmental programmes, investment decisions will be based on other factors.

- There should be descriptions of how economists value the beneficial ways in which ecosystems affect people

---

4. **Clearing-House Mechanism**

Rationale:
The Clearing-House Mechanism (CHM) of the Convention on Biological Diversity is a platform to promote and facilitate technical and scientific cooperation and information exchange related to biodiversity conservation and its related issues.

Through the CHM, a global mechanism for exchanging and integrating information on biodiversity is being developed.

- The dissemination of project reports and of information about legislation issues or best practices through the CHM should be an integral part of capacity-building.

---

5. **Information Management**

Rationale:
Partners involved in biodiversity conservation are responsible for providing the relevant information to education and capacity-building centres.

- The centres are dealing with the management of the received information for further dissemination.

---

6. **Public Awareness/Education**

Rationale:
Capacity-building for enhanced public awareness and environmental education forms the base for the social acceptance of biodiversity conservation and the sustainable use of biodiversity components. It is an essential tool to support development management and the implementation of nature conservation issues.

To some extent, CEECs are still lacking public awareness programmes supporting the implementation of programmes or actions for biodiversity conservation (e.g. by showing best practices or lessons learned).
Results and Recommendations

- In terms of the CBD implementation, awareness raising programmes, training sessions or workshops should enable all stakeholders, including local communities, to understand the nature and importance of the respective topics.

7. In-situ Conservation

Rationale:
In-situ conservation is the conservation of ecosystems and natural habitats and the maintenance and recovery of viable populations of species in their natural surroundings (Art. 2, CBD).

It is crucial to build capacities and relevant frameworks for in-situ conservation within and outside protected areas in CEECs. In the context of the increased loss of biological diversity, capacities and incentive measures for in-situ conservation should be mandatory.

Further actions regarding in-situ conservation are:
- Education on site management plans for in-situ conservation.
- Developing the skills of site managers.

Thematic areas related to in-situ conservation:

a) Protected Areas Systems
- The systems of protected areas guarantee measures undertaken for biodiversity conservation.
- They provide gene-pools, therefore they are outmost important for the existence of biological diversity by having sufficient genetic varieties for responding to the change of the environment.

b) Alien Species
- Alien species can threaten ecosystems, habitats or species. There is need to promote concrete actions for dealing with this problem in CEECs.
- There is a need to train scientists and protected areas managers on how to cope with eliminating the negative effects of their occurrence and their impacts on native species.

8. Topics for future consideration

The following areas have been identified as potential areas for capacity-building but were not chosen to be of higher priority. The order is alphabetical and does not follow specific priorities.
- Benefit sharing
- Contributing to/following CBD process
- Drylands
- Ex-situ conservation
- Global Strategy for Plant Conservation
- Impact assessment
Results and Recommendations

- Incentive measures/compensation
- Integration of research in decision making
- Liability and redress
- Marine and coastal biodiversity
- Taxonomy
- Traditional knowledge

Working Group 4: Integrated Policy Formulation and Implementation as a Priority Goal for Capacity-building

Introductory remark: In working session 3, “Integrated Policy Formulation and Implementation” was identified by the participants as the single most important area for capacity-building in Central and Eastern European countries (CEECs). Because of the complex nature of the issue, the fourth working group decided to further specify the capacity needs of relevant actors and discuss the instruments which could be used to address them.

The reasons for the prioritisation of “Integrated policy formulation and implementation” as a goal for capacity-building were identified as follows:
- It can help to increase public involvement
- Improvement of horizontal and vertical integration is needed
- Integration is needed on strategic level
- Enforcement of existing regulations etc. can be improved
- The effectiveness/utilization of existing capacities can be enhanced
- There is a need to build new partnerships for biodiversity conservation

The following actors in integrated policy formulation and implementation were considered important:
- Technical staff in relevant administration
- Politicians on the local, regional and national level
- The public
- NGOs
- Science / academia
The **needs** for capacity-building for these actors were described as the following:

<table>
<thead>
<tr>
<th>Technical staff</th>
<th>Politicians</th>
<th>Public</th>
<th>NGOs</th>
<th>Science/academia</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Number of staff</td>
<td>6. Knowledge on means for integration</td>
<td>9. Awareness of opportunities for involvement (e.g. Århus-Convention)</td>
<td>13. Education of specialists in governance</td>
<td></td>
</tr>
<tr>
<td>3. Interdisciplinary skills and knowledge</td>
<td>7. Awareness of need for expertise</td>
<td>11. Knowledge on means for integration</td>
<td>15. Holistic approaches</td>
<td></td>
</tr>
<tr>
<td>4. General knowledge on relevant international processes (guidance, obligations, opportunities)</td>
<td>12. Networking in a thematically wide range of NGOs</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>5. Capacities for communication</td>
<td></td>
<td>16. Communication skills</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>17. Acknowledgement of importance of traditional knowledge</td>
</tr>
</tbody>
</table>

The working group identified the following **capacity-building instruments** that could be used to address the needs listed above (the numbers in brackets refer to the numbering of needs in the table above):

- Encourage allocation of environmental focal persons in other sectors (1)
- Seconding of experts (1)
- Outsourcing of services by collaboration with NGOs and science (1)
- Dissemination/presentation of case studies and best practice (2, 12, 17)
- Present financial benefits and advantages (2, 6, 8)
- Advertising for training in cooperation with National Focal Points (3, 4, 5)
- Training (3, 4, 5, 10, 11, 16)
- Publications (3, 4, 5, 9, 10, 11)
- Web-based information services/thematic e-groups (3, 4, 5, 9, 10, 11, 12)
- Networking/conferences/expert meetings (3, 14, 15)
- International meetings (4)
- Promoting peer-to-peer education (4, 12)
- Set-up/improvement of relevant advisory services (6)
- Advertising sectoral integration by involving key decision-makers (6)
- Gap analyses and needs assessments (7, 14)
- Assist educational institutions to develop curricula (8, 9, 11, 13, 15)
- Media (8, 9, 10)
- Adult education (8, 13)
- Start-up meeting (12)
- Creating science-policy interlinkage platforms (14, 15)
- Inventory, codification and dissemination (17)
Working Group 5: Monitoring the Success of Capacity-Building

Introductory remark: The question of how the success of capacity-building activities can be monitored was taken up in several presentations held at the workshop and proved during discussions to be a matter of interest to many participants. It was therefore decided to further discuss the issue in a separate working group.

In order to ensure the effectiveness of capacity-building activities regular monitoring should be conducted. Monitoring requires appropriate indicators for evaluation, which are different for each group of recipients. In the discussion, a list of recipients was pointed out which the participants perceived as the most important with regard to the objectives of the Convention on Biological Diversity (CBD). Many of the suggested indicators are fairly general and could be applied to any organisation / any form of capacity-building. Prior to applying the indicators they should be adapted and elaborated further in order to match them with the existing needs and trends in the region.

The presented list of indicators is aimed to measure the achievement of goals rather than to evaluate the performance of instruments in capacity-building (see figure 1).

![Figure 1: The monitoring process in capacity-building](image-url)
Results and Recommendations

The following are the recipients and the corresponding indicators:

GOVERNMENT:
- Governments spend more money and man power to the subject (e.g. in CBD agency)
- New legislation in place and enforced (e.g. nature park)
- Governmental ranks which appear on international level (Queen, Prime Minister, ministers…)
- interoperability of data / compatibility of data
- number of interviews given on CBD issues by government representatives
- implementation of green (eco-) taxation schemes

NGO:
- number of staff working on CBD issues
- number of them in contact with the SCBD
- number of contacts with National Focal Points (NFPs)
- number of invitations to take part in decision making
- number of seminars and training run by NGOs in CBD context
- number of functioning NGOs working on CBD issues
- amount of financial resources

SCIENTIFIC INSTITUTIONS:
- number of publications and media appearance on CBD issues
- number of scientists and institutions cooperating with NFPs
- number of research projects (funding allocation) about and within CBD
- ranking of CBD issues on list of research priorities
- number of databases and inventory work
- presence of scientific community in decision making and visibility in public
- interoperability of data / compatibility of data

PUBLIC:
- public awareness on CBD
- appearance and frequency of CBD issues in media
- number of websites (private and institutional)
- number of hits on websites including those of the CHM
- ranking in search engines
- size of environmental membership organisations
- number of visitors at biodiversity events

BUSINESS:
- decrease in number of harmful or non-sustainable projects and products
- number of green (eco)-label products and firms
- number of green (eco) jobs
- number of companies having functioning environmental strategy in place
